

### MINE token

The MINE token is a decentralized unit backed by the yield from Prozium Protocol's mining operations. Wallets that stake PRZ tokens receive MINE tokens through an airdrop (i.e., MINE tokens are automatically credited to their wallet).

Contract adress of the token is 0x85f05Db0bB5f5579720C7a97E360A15Cf89233E7 (BSC network).

The amount of MINE tokens automatically credited to a staking wallet each period depends on:

- the current yield from Prozium Protocol's mining operations
- the total number of PRZ tokens in the staking pool
- the staking period during which the wallet is staking PRZ tokens – a longer staking period results in more MINE tokens:

PERIOD	MINE TOKEN MULTIPLICATOR
180 days	x1
360 days	X2
720 days	X3

The MINE token is:

- paired with Ethereum in a liquidity pool, currently the second-largest cryptocurrency
- freely tradable on the decentralized exchange UNISWAP.

To liquidate the MINE token, it must be swapped on the decentralized exchange UNISWAP for any cryptocurrency on the Binance Smart Chain. For example, the MINE token can be swapped for Ethereum or USDT tokens, which the user can then freely use – e.g., send to a centralized exchange of their choice (most commonly Binance or MEXC) and further trade for other cryptocurrencies or exchange for fiat currencies to be transferred to their bank account.
